

Cloud Jumping Procedures

- 1) No tracking/movement jumps
- 2) Don't dive towards formations you can't see
- 3) Do slow right spirals under canopy

In the Plane

- **If the cloud is too low or thick for your experience level, opt to stay in the plane**
- **If the clouds appear no longer suitable for your planned skydive, change your plan.**

In Free Fall

- **If you are approaching others and you lose sight of them . stop your approach and hold a neutral body position until you regain visual of the group**
- **If there's cloud at break off and/or deployment altitude, limit groups to 4 or less**

Under Canopy

- **If you are in or above cloud, release the breaks and immediately start a right hand turn**
- **Continue turning until you ave a clear visual of an appropriate landing area**
- **Look and listen for others while flying through the cloud**

To Jump or not to Jump

Ultimately it is your choice if you exit the aircraft. If you think the clouds are not suitable or may be beyond your skill level you can decide not to manifest yourself, enter the plane or jump.

If in doubt, sit it out!
